Ministry of Construction, Myanmar

Myanmar

NATURE BASED SOLUTIONS

bio-engineering

The objective of the Government of Myanmar's Flood and Landslide Emergency Recovery Project is to support the recovery in priority areas affected by the 2015 floods and landslides and to provide immediate and effective response in potential future eligible crises. The project components will include the climate-resilient rehabilitation of national and rural roads and the provision of eligible goods. The project will finance, among a host of rehabilitation and maintenance activities, the elevation of flood-prone road sections, drainage improvement, slope stabilization, landslide protection, and bio-engineering techniques. The target areas will benefit from improved connectivity and restored access to markets and social services. The project will also include a component on contingent emergency response.
